

how does the skill creation skill work? → created a wasm.

i also want to work on salad and make a prettier firmware for doing GPIO signals, controllable remotely over REST so we can iterate on salad, but let me dig into remark42 and the debugging

the JS stuff can be dealt with as modules with export as well. lol all this started by wanting to search my remarkable tablet

→ i can make a little webpage for remark42 as well to quickly search, and do other things, like quickly add todos or expose webAPI to do all kinds of stuff without having to implement, say upload, markdown.

again also with js support.

→ how does a package manager and bundler work with gojs?

↳ CHATGPT research launched

✓ yeah, common. no import/export, transpile to commonJS

DSL + JS gojs support in a remarkable: ~ $\frac{1}{4}$ context window in cursor (so i guess a fair bit of compaction)

□ integrate the diary telling in docuagr

→ there is an unlock with a generic eventviewer/feedback mechanism and maybe along with events we can send js code along as well so that pz-confirm or the visualizer of docuagr has handlers that can use a docuagr api or pz-confirm library.

||—————||

i kinda broke my brain, huh.

→ generalised as "write the code"

↳ "write the app to run code that does X"
followed by "write the code to do X"
is less tedious and certainly many less
when iterating on any issue
