

how does the skill creation skill work? → created a wasm.

i also went to work on salad and make a prettier firmware for doing GPIO signals, controllable remotely over REST so we can iterate on salad, but let me dig into remark42 and the debugging

the JS stuff can be dealt with as modules with export as well. lol all this started by wanting to search my remarkable tablet

→ i can make a little webpage for remark42 as well to quickly search, and do other things, like quickly add todos or expose webapi to do all kinds of stuff without having to implement, say upload markdown.

again also with js support.

↳ how does a package manager and bundler work with gojs?

↳ CHATGPT research launched

✓ yeah, common. no import/export, transpile to commonJS

DSL + JS gojs support i a remarkable: ~ 1/4 context window in cursor (so i guess a fair bit of compaction)

□ integrate the diary tailing in docmgr

→ there is an unlock with a generic eventviewer/feedback mechanism and maybe along with events we can send js code along as well, so that ple-confirm or the visualiser of docmgr has headers that can use an "docmgr" api or ple-confirm library.

||—————||

i kinda broke my brain, huh.

→ generalised as "write the code"
"write the app to run code that does X"
followed by "write the code to do X"
is less tokens and certainly many less when iterating or any issue
